

Lesson 8
JSF Applications
Do Less and Accomplish More

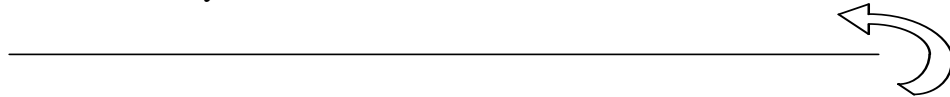

Once you understand the framework, JSF makes developing web applications easy. Once you know your Self, the unified field makes life blissful.

MAIN POINTS

1. Managed beans are where JSF programmers connect to their application logic. JSF pages connect to the beans by using value expressions. We can connect our selves to the unified field through the TM and TM-Sidhi Programs.
2. Action methods *activate* business operations and return navigation decisions. Action methods represent a connecting aspect of knowledge, connecting the external user interface with the underlying intelligence of the domain model
3. JSF has two standard tag libraries that correspond to tags that are independent of rendering technology (core) and tags that are HTML specific (HTML). Actions in accord with the unified field spontaneously receive the support of all the laws of nature.

**CONNECTING THE PARTS OF KNOWLEDGE WITH
THE WHOLENESS OF KNOWLEDGE**

1. JSF simplifies building web applications through a framework that imposes good design principles and a rich set of convenient GUI components.
2. Key ingredients of a JSF application include managed beans, JSF pages incorporating the JSF standard tag libraries and EL expressions and action methods to connect to the managed beans, and an XML configuration file where navigation rules and other items are declaratively defined.

3. **Transcendental consciousness** is the direct experience of pure consciousness, the unified field of all the laws of nature.
4. **Wholeness moving within itself:** Understanding the JSF framework makes developing web applications simple and blissful. A master developer appreciates the operation of the framework underlying the application. In unity consciousness one lives the wholeness of pure awareness in daily life and perceives the same pure awareness underlying the operation of the rest of the universe.
